

MASSACHUSETTS HOMEOWNER GUIDE

Heat Pump Virtual Presentation

How mini-splits work, available Mass Save incentives, and the Nexis Power process.

MA HOMEOWNERS

MINI-SPLITS

REBATES + 0% FINANCING

Comfort in winter. Cooling in summer. Lower-carbon home energy.

ROADMAP

Today's homeowner conversation

A simple flow that educates first and makes the next step clear.

01 Why heat pumps now

02 How the system works

03 Parts of a mini-split

04 Mass Save incentives

05 Nexis process

06 Objections + answers

ENERGY + COMFORT

Why Massachusetts homes are upgrading

Heat pumps solve more than one problem: heating, cooling, comfort, and long-term home electrification.

2–3x

as efficient as a boiler or furnace for today's cold-climate heat pumps

-15°F

many cold-climate systems can provide efficient heat at very low outdoor temperatures

All-in-one

heating, cooling, and dehumidification from one system

Flexible

ducted or ductless options for one room, many zones, or whole home

Homeowner takeaway

A heat pump is not just an “AC upgrade.” It is a comfort system that can reduce fuel dependence, improve room-by-room control, and prepare the home for solar or battery backup.

HOW IT WORKS

Heat pumps move heat instead of making heat

In winter they pull heat from outside air and move it indoors. In summer they reverse the cycle and move heat out.

1. Outdoor unit

Absorbs or rejects heat with a compressor and fan.

2. Refrigerant lines

Carry heat energy between the outdoor and indoor units.

3. Indoor head

Distributes warm or cool air into the room.

4. Controls

Thermostat/remote sets comfort and schedules.

Plain-English explanation

It works like a refrigerator in reverse: the system collects heat where it is not wanted and releases it where it is needed.

One system, two seasonal jobs

The reversing valve lets the same equipment heat in January and cool in July.

WINTER: heat moves inside

Inside air handler

Blows conditioned air quietly into the room.

SUMMER: heat moves outside

Outdoor condenser

The compressor and coil transfer heat with outdoor air.

Reversing valve

Changes refrigerant direction so the system can heat or cool.

Parts of a ductless mini-split system

A clean installation combines mechanical, electrical, controls, and weatherization details.

Outdoor unit

Compressor, outdoor coil, fan, base pad or wall bracket, and service access.

Indoor unit

Wall head, cassette, ducted air handler, filtration, fan, louvers, condensate drain.

Line set + electrical

Refrigerant piping, insulation, disconnect, wiring, exterior line-hide, drain routing.

Controls + zones

Remote, smart thermostat options, integrated controls, and per-room zoning.

What homeowners usually care about most

Position the value around comfort and cost control—not just equipment.

- Year-round comfort: heating, cooling, and humidity control.
- Room-by-room zoning can reduce hot/cold spots.
- No fuel deliveries and no in-home combustion for ductless zones.
- Pairs well with solar, battery, EV charging, and home efficiency.
- Mass Save incentives can materially reduce upfront cost.

Comfort framing for sales

“The goal is not just a lower bill. The goal is a home that feels better in every season with a clear plan for energy costs.”

MASS SAVE INCENTIVES

2026 heat pump rebates in Massachusetts

Values can change. Nexis should verify eligibility, equipment, and forms before quoting any final incentive.

Whole-home rebate

\$2,650 per ton up to \$8,500 when the heat pump is the sole source for heating and cooling.

Partial-home rebate

\$1,125 per ton up to \$8,500 when the heat pump supplements an existing system.

Basic rebate

\$250 per ton up to \$2,500 for specific non-displacement projects.

Income-based

Up to \$16,000 or up to no cost through Turnkey Services.

Also available: 0% HEAT Loan financing up to \$25,000 for qualifying energy upgrades.

How to make the project rebate-ready

The goal is to avoid surprises: check utility sponsor, home condition, equipment list, and installation requirements before signing.

1. Confirm sponsor

Eversource, National Grid, Unitil, Cape Light Compact, etc. depending on fuel and electric/gas account.

2. Home assessment

Weatherization matters, especially for whole-home systems.

3. Design + sizing

Manual J load calculation, zones, backup heat strategy, electrical capacity.

4. Install eligible equipment

ENERGY STAR Cold Climate and on Mass Save qualified product list.

5. Submit documentation

Forms, invoice, verification, controls, photos, and deadline.

Important 2026 equipment note

Mass Save notes that R410 systems have been removed from the HPQPL because of the EPA transition; verify model eligibility before installation.

From first call to installed comfort

A sales-ready timeline that homeowners can understand in a virtual consultation.

Nexis value

One energy partner to coordinate heat pumps, weatherization, solar readiness, and future electrification.

Customer experience

Clear scope, realistic timeline, clean installation, and support after the sale.

What determines the right heat pump system?

The best proposal is designed around the home—not a generic equipment package.

- What rooms are uncomfortable today?
- What fuel are you replacing or reducing?
- Is the home insulated and air-sealed?
- Will the system be whole-home or partial-home?
- Does the electrical panel need upgrades?
- Are there future solar, battery, or EV plans?

Sizing principle

Oversized systems can short-cycle; undersized systems may struggle in cold weather. Nexis should verify heating load, equipment capacity, and zone layout before final scope.

How incentives change the conversation

Help the homeowner compare “project cost” versus “net cost after rebates and financing.”

Payment strategy

Combine verified rebate eligibility with the Mass Save 0% HEAT Loan, when qualified, so the homeowner can evaluate the remaining net cost in a simple monthly view.

Heat pumps + solar create a stronger plan

Electrifying heating can increase electric use. Solar can help offset that new load when designed as part of the long-term energy plan.

1. Improve shell: insulation + air sealing

2. Replace fuel load with heat pump zones

3. Add solar sized around future electric use

4. Add battery/EV charging when it makes sense

Nexis positioning

Nexis can help homeowners avoid one-off decisions by building a home energy roadmap: comfort first, incentives second, long-term power strategy third.

OBJECTIONS + REBUTTALS

Common homeowner concerns

“Will it work in MA winters?”

Yes. Cold-climate systems are designed for low temperatures; proper sizing and weatherization matter.

“Is it ugly or noisy?”

Modern units are compact and quiet. Placement, line-hide, and installation detail matter.

“Is the rebate guaranteed?”

No rebate is guaranteed until eligibility, equipment, forms, and program rules are verified.

“Will my electric bill go up?”

Electric use increases, but fuel use can decrease. We compare your full energy picture, not one bill line.

“What if I keep my boiler?”

Partial-home designs can supplement existing systems; integrated controls may be required for rebates.

“Why not wait?”

Incentives, equipment rules, and contractor availability can change. We help you compare now versus later.

The difference is a complete energy partner

Homeowners need more than a unit on the wall—they need a plan, clean execution, and support.

- Massachusetts energy expertise
- Heat pumps, solar, battery, and efficiency in one conversation
- Clear proposal with rebates, scope, and timeline
- Professional installation coordination
- Customer-first support after the project

Positioning line

“Nexis is not here to sell one product. We are here to show whether your home qualifies, what the incentives can do, and what energy plan makes the most sense.”
